

Cold sore coming on? Have no fear, laser therapy is here!

At New Smiles, our DEKA CO2 laser can be used to treat everything from cold sores to periodontal disease to plastic surgery of the gums.

Here's how it works. By using a low energy level, the laser can be used to gently stop a cold sore in its tracks before it becomes an ugly, embarrassing distraction.

The DEKA CO2 laser is also great at treating periodontal (gum) disease and gingivitis. By applying the laser to deep pockets it has been shown to decrease these pockets and improve the overall health of the gums and bone.

By increasing the energy level, our laser can be used to sculpt the gum line around short looking teeth creating a natural, beautiful smile. So if you have ever felt you have a "gummy smile" we may have the solution for you!

So remember, the next time you feel that tingle on your lip don't hesitate to call New Smiles. The procedure only takes about five minutes and will give you the confidence and satisfaction knowing that you eliminated that ugly cold sore before anyone ever noticed.

"Change your smile, change your life."
